

# 182 How many main grids are there for photovoltaic panels

## Overview

---

Currently, there are two main camps of silicon wafer sizes in the global PV industry, namely the 182 camp represented by Longi Green Energy, JinkoSolar, and JA Technology, and the 210 camp represented by Central, Trina Solar, and Rising East. For most of the past 100 years, electrical grids involved large-scale, centralized energy generation located far from consumers. Let's explore how . They normally consist of about one hundred to several thousand acres of ground-mounted solar panels that produce electricity for transmission into the power grid for use off-site. A grid-scale solar development typically generates more than 5 megawatts (MW) of electricity, which can be sold to a . The layout of PV modules has been changing with the changes in cell size, from 5\*12 for square cell combinations to 6\*24 for half-cut cell combinations, module designers have never stopped on the road to cost reduction and efficiency. Additionally, we provide information on .
