## Overview

---

The IEC 61508 standard is the foundational standard for functional safety compliance in Battery Management System (BMS) design for industrial and automotive use. It outlines a risk-based approach to hardware and software design, thus mitigating the chances of failures and safety risk. The battery management system (BMS) monitors the battery and possible fault conditions, preventing the battery from situations in which it can . In designing a reliable battery management system (BMS), engineers must consider the state of the battery, its health, and how it is protected from all possible risks. This article provides a comprehensive overview of BMS core functions, hardware modules, and mainstream system architectures . In high voltage battery applications, safety standards & regulations reduce the risks associated with critical events such as electricity fluctuations, fire, thermal runaway, or chemical leakage. Such high-power systems, if not handled properly, may lead to fires, explosions, environmental damage .
