

# Change capacitors when inverter output voltage is low

## Overview

---

Watch especially on start up where the inverter sees a minimum 10.39V while the capacitor voltage drops below 10V (such drop would have caused the inverter to shut down if on battery) . more. An inverter is a power electronic device that converts direct current (DC) power, often from batteries or solar panels, into alternating current (AC) power. This conversion requires precise energy management, and the capacitor is central to this task, functioning as an energy storage and . The low internal resistance of the lifepo4 batteries pretty much handle inrush with minimal voltage drop. Also the size of a battery so a space hog. The FETs are conducting correctly and fully, the 2.
