Microgrid Simulation , Advanced Microgrid Testing

Always at the cusp of innovation, our solutions test the systems required for any level of microgrid control, whether through real-time or accelerated simulation.

Electronics

Since electronics is concerned with the control of the motion of electrons, one must keep in mind that electrons, being negatively charged, are attracted to positive charges and repelled by

2.1.1. Maximum Power Point Tracking (MPPT) Converter Solution The main task of the MPPT converter within the proposed microgrid is to convert the fluctuating DC voltage obtained from photovoltaic panels to a stable DC voltage. The MPPT algorithm, i.e., the algorithm for achieving the highest possible panel performance, is implemented in the inverter control system if HIL is considered. The most common and simplest solution for the mentioned application is a traditional boost converter, which, in addition to its simple design, also provides very high efficiency (with a synchronous rectifier of up to 99%). For higher outputs (of the order of kW, MW), the structure can be supplemented by other identical converters (1 to n), and then the individual converters work with a phase shift (interleaved). By using an interleaved topology, we obtain lower output voltage ripple, lower input current ripple, and a smaller overall drive volume, but at the cost of design complexity, more complex control, and potentially higher costs [23]. Figure 3 depicts an improved dual interleaved converter by implementation of flux reset circuitry within the main topology [19-21]. It consists of additional inductance and output diodes. All three inductors must be wound on one magnetic core. The PWM signals are phase shifted by 180° and the pulse width range can be from 0% to 90% (dependent on the inductor construction). The inverter achieves a high voltage gain (higher than a traditional boost converter) with high efficiency (up to 96%). In addition, the voltage gain can also be changed by the ratio of the turns (inductances) of the coupled inductor, while it must be valid that $N1 = N2 : N3$. A detailed study regarding this topic is available in [25-27].

3. Evaluation of the Accuracy of the Hardware-in-the-Loop (HIL) Simulation Models

5. Discussion

6. Conclusions

In this paper, the procedure of the HIL modeling referred to as the power stage of the smart grid was discussed. The main focus was the development of high-precision simulation models of individual power converters belonging to an SG concept, while a piecewise linear electronic circuit simulator is used.
