

# Energy management of hybrid solar container energy storage system

## Overview

---

Our hybrid systems leverage core technologies like DC-coupled architecture (system efficiency up to 98.5%) and VSG (Virtual Synchronous Generator) technology (seamless switching within 10ms), prioritizing solar energy, intelligently managing storage, and activating diesel. Hybrid solar container power systems are modular and containerized energy systems that combine solar photovoltaics, battery energy storage, and other power sources, such as diesel generators or grid power, in a single, transportable package. They are intended for areas where the electricity supply is unreliable. In response, MEOX Off-Grid Container Power Systems has emerged as a modular, rapidly deployable solution (4-hour setup) that integrates solar, storage, and diesel backup for reliable energy independence. Microgrids (MGs) play a fundamental role in the future of power systems by providing a solution to the sustainability of energy systems, energy storage units are important, which can regulate the safe and stable operation of the power system. However, different energy storage methods have different environmental and economic impacts in renewable energy systems. This system is integrated into the traditional electricity network.
