

# Energy storage container charging and discharging test plan

## Overview

---

This review presents a first state-of-the-art for latent heat thermal energy storage (LHTES) operating with a simultaneous charging-discharging process (SCD). The charging, storage, and discharging pressure and temperature of hydrogen gas in the cylinder values for this configuration are illustrated in Fig. 63 °C, respectively, were experienced by group 3, 46. 92 °C . Specific ES devices are limited in their ability to provide this flexibility because of performance constraints on the rate of charge, rate of discharge, total energy they can hold, the efficiency of storage, and their operational cycle life. While pack- or rack-level testing verifies individual components, container-level testing addresses system-wide . This report describes development of an effort to assess Battery Energy Storage System (BESS) performance that the U. Department of Energy (DOE) Federal Energy Management Program (FEMP) and others can employ to evaluate performance of deployed BESS or solar photovoltaic (PV) +BESS systems.
