

# Energy storage peak-valley electricity price difference cost

## Overview

---

The peak-valley price difference of energy storage can vary significantly, with an average range of \*\*\$20 to \$50 per megawatt-hour, depending on numerous factors including location, demand fluctuations, and market dynamics. Using peak-to-valley spread arbitrage is currently the most important profit method for user-side energy storage. It charges the energy storage power station during the low grid period at night, Discharge during the peak hours of electricity consumption during the day to achieve the purpose of . How much can the peak-valley price difference of energy storage be?

1. Table he annual net revenue of the BESS also decr as I Scientifically divide peak and valley periods. All localities should consider the local power supply-demand status,system power load characteristics,the proportion of new energy installed capacity, in . Industrial and commercial users can charge the energy storage battery at a cheaper low price when the load is low.
