

Is photovoltaic energy storage floating charge or equal charge

Overview

Unlike a lead-acid battery, a lithium battery does not need a float charge. Solar charge controllers put batteries through 4 charging stages: What are the 4 Solar Battery Charging Stages?

For lead-acid batteries, the initial bulk charging stage delivers the maximum allowable current into the solar battery to bring it up to a state of charge of approximately 80 to 90%. So, what happens is it goes into a "Balancing mode" where the less-than-100% cells continue to charge and the 100% cells are diverted into internal resistors so they are no over charged. This stage follows the bulk and absorption stages in a typical charging cycle. The primary purpose of float charging . Adding battery storage to your solar installation is more affordable than ever before.
