Overview

A typical lithium-ion battery consists of two current collectors, an anode, a cathode, a separator and electrolyte. Lithium-ion battery current collectors collect electrode current and boost battery performance-this guide covers ideal material criteria, mainstream metal (Cu, Al, Ni, SS) and carbon/composite types, their properties, applications and performance optimization methods. CCs serve a vital bridge function in supporting active materials such as cathode and anode materials, binders, and conductive additives, as well as electrochemically . As a researcher focused on next-generation energy storage, I have witnessed the pivotal role of lithium-ion batteries in powering our transition to sustainable transportation.
