## Overview

---

This paper aims to model the Superconducting Magnetic Energy Storage System (SMES) using various Power Conditioning Systems (PCS) such as, Thyristor based PCS (Six-pulse converter and Twelve-pulse converter) and Voltage Source Converter (VSC) based PCS. This use of superconducting coils to store . In this dissertation a novel controller is designed for controlling the Magnetic Energy storage system ensure: (a) Fast return of energy to the superconducting coil under constant current mode and (b) A constant and sinusoidal input supply current irrespective of the varying load demand with and . Superconducting Magnet Energy Storage (SMES) systems are utilized in various applications, such as instantaneous voltage drop compensation and dampening low-frequency oscillations in electrical power systems. Numerous SMES projects have been completed worldwide, with many still ongoing. To represent the state-of-the-art SMES research for applications, this work presents the system modeling, performance evaluation, and application prospects of emerging SMES techniques in modern power . , ultra-high field SMES coil using second generation (2G) high-temperature superconductor (HTS) wire.

Superconducting magnetic energy storage (SMES) systems store energy in the magnetic field created by the flow of direct current in a superconducting coil that has been cryogenically cooled to a temperature below its superconducting critical temperature. This use of superconducting coils to store magnetic energy was invented by M. Ferrier in 1970. A typical SMES system includes three parts: superconducting coil, power conditioning system and cry
