

Photovoltaic panel line blocking

Overview

A blocking diode is required in each 'series string' of solar modules between the modules and regulator/battery, to prevent current flowing back through the modules when the modules are shaded or during darkness. Check each product page for other buying options. This use of bypass diodes in solar panels allows a series (called a string) of connected cells or panels to continue supplying power at a reduced voltage rather than no power at all. You may be wondering, what is the difference?

Well, not much. The blocking diode acts like a one-way valve, allowing current to flow only one way . A blocking diode and bypass diode are commonly used in solar energy systems and solar panels.

Bypass Diodes in Solar Panels and Arrays

Bypass diodes in solar panels are connected in "parallel" with a photovoltaic cell or panel to shunt the current around it, whereas blocking diodes are connected in "series" with the PV panels to prevent

Do Solar Panels Need Blocking or Bypass Diodes?

A question that I get asked often is; do solar panels need blocking or bypass diodes? In this article I answer both of these questions with examples.
