How Does Solar Work?

When the sun shines onto a solar panel, energy from the sunlight is absorbed by the PV cells in the panel. This energy creates electrical charges that move in response to an internal electrical field in

Solar panels

In our Explore Physics series, we look at how solar panels convert sunlight into electricity.

How solar panels work, in theory and in practice

One is due to the heating of the panels during daylight hours, resulting in their being less efficient. The other is manifested as an increase of power that occurs when the sky is partially filled

How Do Solar Panels Work? An In-depth Guide

As solar panels produce direct current (DC) energy, inverters convert it into alternating current (AC) energy. An entire solar energy system typically uses just one inverter to convert direct current

Solar panel

Solar panels use a renewable and clean source of energy, and reduce greenhouse gas emissions

compared to hydrocarbon-sourced energy. However, they depend on the availability and intensity of

[How Do Solar Panels Work? Photovoltaic Guide 2025 , SolarTech](#)

While an LED converts electrical energy into light by allowing electrons to flow from high to low energy states, solar panels do the opposite—they absorb light photons and use that energy to

How do solar panels work? Solar power explained

At a high level, solar panels are made up of solar cells, which absorb sunlight. They use this sunlight to create direct current (DC) electricity through a process called "the photovoltaic effect."
