

Solar inverter ground wire leakage

Overview

A ground fault occurs when a conductor in the DC system unintentionally contacts ground. This creates a leakage path, which can trigger insulation resistance faults, trip monitoring systems, or compromise inverter safety protocols. At first, it sounds technical and scary, but don't worry-by the end of this guide, you'll understand exactly what it is, why it matters, and what you can do about it. In this article, we'll show you how to locate a ground fault in a solar PV string using only a multimixer, a basic understanding of voltage behaviour, and a method proven in real-world . It means you have a connection to ground on the DC side - think of a wire with damaged insulation touching the panel frame or roof or another wire, or moisture bridging the damaged wire to the nearby metal. You mention squirrel damage, so it's probably related. This includes locking out any disconnects and enclosures to prevent someone from mistakenly flipping breakers or reconnecting inverters.
