Overview

The low frequency inverters typically operate at ~60 Hz frequency. It performs the critical task of converting direct current (DC) from your solar panels into alternating current (AC) for your home or the grid. In order to generate more precise sinusoidal AC voltage waveforms and keeping the size of the LC filter small, high modulation frequencies are generally used. One is PWM modulation frequency & second originates in the switching transients of the power electronics switching devices such IGBTs. An LC filter is . Divided by the frequency of output AC power: industrial frequency inverter (frequency: 50-60Hz), medium frequency inverter (frequency: 400-20kHz) and High frequency inverter (frequency: 20kHz-10MHz).
