

The power storage power source is lithium battery

Overview

The most common type of battery used in grid energy storage systems are lithium-ion batteries. A lithium-ion battery or Li-ion battery is a type of rechargeable battery that uses the reversible intercalation of Li^+ ions into electronically conducting solids to store energy. A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to . Battery energy storage systems provide electricity to the power grid and offer a range of services to support electric power grids. Many fast-growing technologies designed to address climate change depend on lithium, including electric vehicles . Every lithium-ion battery is composed of one or more cells, which work together to deliver energy. The rechargeable battery was invented in 1859 with a lead-acid chemistry that is still used in car batteries that start internal .

Generally, the negative electrode of a conventional lithium-ion cell is made from graphite. The positive electrode is typically a metal oxide or phosphate. The electrolyte is a lithium salt in an organic solvent. The negative electrode (which is the anode when the cell is discharging) and the positive electrode (which is the cathode when discharging) are prevented from shorting by a separator. The electrodes are connected to the po
