

Wind-solar-DC microgrid

Overview

This project develops a standalone DC microgrid that combines photovoltaic panels, wind turbines, and a battery storage system. The system addresses the challenges of variability in renewable energy and ensures voltage stability, power reliability, and high renewable penetration. The proposed method utilizes a dual closed-loop control structure, employing a two-step MPC approach in the inner current loop to enhance the system's dynamic response performance. Secondly, the integral sliding mode control algorithm is embedded into the Linear Active Disturbance Rejection (LADRC).
